

Azure AI Search Role Assignment

Phase 1 Corporate Policy RAG Deployment

Recommended scope: Resource group

Why this is the correct selection

Azure AI Search is not shown as a separate scope option in the preview menu. For your Phase 1 deployment, select the resource group that contains the Azure AI Search service.

Recommended setup steps

1	Select Resource group .
2	Choose the resource group that contains your Azure AI Search service.
3	Select the managed identity, service principal, or user that needs access.
4	Assign the role or roles required for the Phase 1 task.

Roles commonly used for Azure AI Search

Role	Use
Search Service Contributor	Manage the search service and its configuration.
Search Index Data Contributor	Create, update, and load index data.
Search Index Data Reader	Query and read indexed content without changing it.

Phase 1 recommendation

For development and indexing, the identity usually needs **Search Service Contributor** and **Search Index Data Contributor**. For a runtime component that only retrieves policy content, use **Search Index Data Reader** where possible.

Least-privilege note: A resource-group assignment applies the selected role to all applicable resources in that resource group. For a tighter production configuration, assign roles directly from the Azure AI Search resource's **Access control (IAM)** page.
