Hi Steven Scott,

Thank you for contacting Microsoft support. I understand the urgency of resolving this issue, and I am committed to helping you find a solution as quickly as possible.

After reviewing everything you provided, here's what we know:

Current understanding:

You are using an Azure AI Search Serverless service. In the Azure portal, both the Data Sources and Skillsets pages return HTTP 400 errors stating:
"Serverless services cannot enumerate resources without paging. Use a more recent API version that supports server-side pagination."
As a result, you cannot populate the Data Source or Skillset dropdowns on the Add Indexer page, even though creation of those resources succeeds.

Root cause:

Azure AI Search Serverless requires that resource-enumeration APIs support server-side pagination via the \$top/\$skip parameters. The Azure portal is currently calling an older API version (for example, 2020-08-01) that does not implement pagination for serverless services. This mismatch causes the portal's GET requests for Data Sources and Skillsets to fail with HTTP 400.

Recommended steps:**1. Use Azure Resource Explorer (Portal GUI alternative):**

- In your browser, open <https://resources.azure.com> and sign in with the same account.
- Navigate the tree to:Subscriptions > > resourceGroups >
- Select **dataSources** or **skillsets**.
- In the URL textbox at the top, ensure you have the management-plane API version set, for example:?`api-version=2022-02-01`
- Click **GET** to retrieve the list of resources.

2. Use Azure CLI:

Install or update the Search extension if needed:

```
az extension add --name search
```

```
az extension update --name search
```

List Data Sources:

```
az search data-source list \

--resource-group {resource-group} \

--service-name {search-service-name} \

--top 50
```

List Skillsets:

```
az search skillset list \

--resource-group {resource-group} \
```

```
--service-name {search-service-name} \
```

```
--top 50
```

3. Use REST API (any HTTP client):

```
GET https://{search-service-name}.\$top=50
```

```
api-key: {admin-key}
```

```
GET https://{search-service-name}.\$top=50
```

```
api-key: {admin-key}
```

After retrieving Data Sources and Skillsets via one of these methods, you can use the resource names or IDs when creating an indexer.

Helpful information:

- Azure Portal support for Serverless resource enumeration is planned in an upcoming portal update. Until then, use CLI or REST as shown.
- For large lists, use the \$skip parameter to page through results.
- Serverless overview and limits:[Serverless Azure AI Search overview](#)
- Consider scripting resource management to ensure consistent API versions and pagination.

Thanks again,

Microsoft Support

Hello Microsoft Support Team

When I tried Step 1 in your last email, under resourceGroups I didn't see anything under my resource **rg-corp-policy-ai-rag-dev** that would show me AI Search's skills or data sources.

When I tried Step 2, using Azure CLI I continued to receive a no extension found error when trying to install or update the search extension.

```
(base) PS C:\Users\Steven\GitHub-Repositories\Repositories\azure-policy-assistant-rag-solution-source\azure-policy-assistant-function-app
dev> az extension update --name search
The extension search is not installed. Please install the extension via 'az extension add -n search'.
(base) PS C:\Users\Steven\GitHub-Repositories\Repositories\azure-policy-assistant-rag-solution-source\azure-policy-assistant-function-app
dev> az extension add -n search
No extension found with name 'search'

Use --debug for more information
(base) PS C:\Users\Steven\GitHub-Repositories\Repositories\azure-policy-assistant-rag-solution-source\azure-policy-assistant-function-app
dev> az extension update --name search
The extension search is not installed. Please install the extension via 'az extension add -n search'.
(base) PS C:\Users\Steven\GitHub-Repositories\Repositories\azure-policy-assistant-rag-solution-source\azure-policy-assistant-function-app
dev> az extension add -n search
No extension found with name 'search'

Use --debug for more information
```

Are there any other ways to get access to my skills and data sources? This kind of major issue considering this is the main part of the AI Search tool.

Hi Steven Scott,

Hello,

Thank you for trying those steps and sharing the errors you encountered.

Current understanding:

You have a Serverless Azure AI Search service named azure-policy-assist-blob-datasource in resource group rg-corp-policy-ai-rag-dev.

- In Azure Resource Explorer you did not see any dataSources or skillsets nodes under Microsoft.Search.
- When using Azure CLI, attempts to install or update the search extension returned a “no extension found” error.

You need a way to enumerate your existing Data Sources and Skillsets despite these portal and CLI limitations.

Root cause:

Serverless Search services require data-plane APIs (admin API) that support server-side pagination (\$top/\$skip) for resource enumeration.

- The Azure portal currently calls an older API version without pagination support, so listing Data Sources and Skillsets fails with HTTP 400.
- Your CLI environment is unable to load the search extension, preventing use of the built-in az search commands.

Recommended steps:

- Use the REST API directly with az rest (no extension required):

```
az rest --method get \

--url "https://azure-policy-assist-blob-datasource.search.windows.net/datasources?api-version=2023-07-01-Preview&$top=50" \

--headers api-key=<your-admin-key>
```

To list skillsets:

```
az rest --method get \

--url "https://azure-policy-assist-blob-datasource.search.windows.net/skillsets?api-version=2023-07-01-Preview&$top=50" \

--headers api-key=<your-admin-key>
```

Replace <your-admin-key> with the primary or secondary admin key from your Search service (Portal > your service > Keys).

- Alternatively, call the REST API with cURL or Postman:

```
curl -X GET \

"https://azure-policy-assist-blob-datasource.search.windows.net/datasources?api-version=2023-07-01-Preview&$top=50" \

-H "api-key: <your-admin-key>" \
```

```
-H "Content-Type: application/json"
```

- (Optional) Fix the Azure CLI extension issue so you can use az search commands:

- Upgrade Azure CLI to the latest version: az upgrade
- Verify extension availability:

```
az extension list-available --query "[] .name"
```

- If you see search in the list, install it:

```
az extension add --name search
```

Helpful information:

- For lists larger than 50 items, append &\$skip={number} to page through results.
- Native portal support for Serverless Search listing is coming in a future update.
- REST API reference:<https://learn.microsoft.com/azure/search/search-rest-api>
- Serverless overview and known limitations:<https://learn.microsoft.com/azure/search/search-service-serverless-overview>

Please let me know if you encounter any issues with these REST calls or need further assistance.

Thanks again,

Microsoft Support
